TITLE: Considering Climatological Data in the Evaluation of Weather Forecasts (Uchet klimatologicheskikh dannykh pri otsenke prognozov pogody)

PERIODICAL: Meteorologiya i gidrologiya, 1959, Nr 5, pp 40 - 43 (USSR)

ABSTRACT: At the All-Union Conference on Long-term Weather Forecasts in Moscow in 1957, the necessity of considering the climatic and seasonal features of the regions in compiling and evaluating weather forecasts was stated. In this connection, the problem of setting up new regulations for the terminology and evaluation of long-term weather forecasts turned up. The consideration of climatic features in the terminology and evaluation of weather forecasts is very complicated and hits on a number of practical difficulties. This applies particularly to tolerances in the evaluation of weather forecasts. This complicated problem of the selection of tolerances has hardly been worked out. The tolerances used at present are not sufficiently founded, and do not express the physical-geographical and seasonal features of

Card 1/3

Considering Climatological Data in the Evaluation of  
Weather Forecasts

SOV/50-59-5-9/22

the regions. One of the possible variants for the choice of intervals in compiling weather forecasts for 3-7 days, and of the tolerances evaluated according to the two main elements of the weather - precipitations and air temperature - is put forward here. In establishing the criteria for the evaluation of these elements it is convenient to start from a consideration of the features in the distribution of these elements in the region and depending on the season. The most distinguishing characteristic representing the physical-geographical and seasonal features of the respective region is the variability of temperature and precipitations with respect to time. To determine the tolerances in the evaluation of precipitation forecasts it is suggested to use the data available in the climatological handbooks for the whole area of the USSR. On the basis of the data given here, regions with a number of days with no precipitations were ascertained, namely regions with less than 10 days without precipitations, with 10 to 20 days, and with more than 20 days without precipitations per month. For each of these groups, particular tolerances are to be established for the evaluation of precipitation forecasts. To determine the intervals in air temperature forecasts

Card 2 / 3

Considering Climatological Data in the Evaluation of  
Weather Forecasts

SOV/50-59-5-9/22

for 3-7 days and the tolerances in the evaluation of temperature it is convenient to take the variability of the daily average of air temperature every 5 days. Table 2 shows these variabilities. On the basis of such data, charts on the variability of the daily average of air temperature have been compiled for the whole area of the USSR. It is convenient to assume the tolerance with 0.75 of the average air-temperature change over many years. Also the interval in the air-temperature forecasts can be assumed in this way. The tolerance thus chosen will be different for different regions and different seasons. On the other hand, it will be possible to compare the evaluation of the forecast in different places and months. A direct evaluation of the forecasts for different regions showed that it became somewhat lower for regions with a smaller change in temperature, and higher for regions with a greater change in temperature - as compared to the evaluation by the usual method (Ref 3). There are 1 figure, 2 tables and 6 Soviet references.

AUTHOR: Z.L. Turketti

TITLE: Evaluation of lower stratosphere thermal and pressure field features for seasonal weather forecasts

SOURCE: Meteorologiya i hidrologiya, no.10, 1965, 21 - 28

TOPIC TAGS: <sup>12, 44, 55</sup> weather forecasting, long range weather forecasting, stratosphere, atmospheric pressure, atmospheric temperature

ABSTRACT: The author observed that a perturbed, tortuous, meandering pattern of the monthly average 100 millibar altitude lines north of the 60° latitude during July-August predicts a warm following winter in the USSR south of the 60° latitude. A warm winter is also often observed following a delayed formation and movement of the cold center, i.e. the center of the -60C area of the monthly temperature average isotherms on the 100 millibar surface. In this case, the cold center does not reach the North Pole until December or January. A simple, smooth, single cyclone pattern predicts a cold winter; the cold center formation is then usually completed and sta-

3

bilized by November. In the supporting statistical study, the winters were characterized by 1) the relative area (%) occupied by a sign of the predominant anomaly of monthly average surface temperatures in the USSR region south of the 60° latitude; 2) by the area, on which the anomaly exceeded the temperature deviation; 3) by one of six designated winter temerature types. Evaluation of these parameters was made for December, January and February of 8 winters: 1957/1958 to 1964/65. The results are considered significant and useful for seasonal weather forecasts. It is realized that the statistical sample of the gross events is small, but it can be augmented by the additional consideration of seasonal and intraseasonal relationships between circulation patterns and features in the stratosphere and in the troposphere. In the troposphere, the 500 millibar altitude patterns can be considered. The orig. art. has: 2 figures, 1 table.

Title : Several Reasons for the Formation and Development of Water Shoots on Oaks.

Orig Pub : Zap. Khar'kovsk. s.-kh. in-ta, 1957, 16, (53), 151-173.

Abstract : A mass appearance and development of water shoots on the common oak was studied in the oak forests of the Chuguyev-Babchanskiy Forest Economy (Khar'kovskaya Oblast'). It has been established that contrary to the opinion of many authors the fundamental reason for the appearance of a significant quantity of water shoots from previously dormant buds is not the action of light, but rather the total condition of the tree as affected by factors of the

Card 1/3

- 9 -

K.

Abs Jour : Ref Zhur - Biol., No 15, 1958, 67991

external environment. The principal effect of light is to assist in the preservation of those water shoots which have already appeared. Unmixed, one-stage, excessively thick plantations give rise to the even more unfavorable conditions which cause the developments of water shoots. In mixed, two-stage, 40-year old oak plantations with 0.8 overall density (fresh maple-linden oak forest), according to the author's classification the average ball of coverage of the oak trunk is 1.22, i.e. there are slightly more than 25 water shoots on each tree; and in the unmixed oak forests which are simple in form and have an overall density of 1.2-1.3, the average ball is 2.50-2.64, or 50-100 shoots on each trunk. In the first case the average projection of the oak crown was 20.8 square meters, in the second -- only 4.1 square meters. Other conditions being equal, the trees whose growth was stunted were more heavily covered with water shoots. Severe thinning of dense

plantation provokes the development of dormant buds on the trunks. Trunks of both early and late oak forms can become covered with water shoots if they are growing in conditions which are not suitable for the ecology of the particular form. -- V.F. Lebkov

TITLE: Wonderful drugs

PERIODICAL: Nauka i zhytтя, no. 2, 1962, 38-39

TEXT: Drugs fabricated synthetically and from natural sources are described. Chemists have succeeded in obtaining an alkaloid Vinkamin, which is similar to Reserpin, from the local plant Barvinok (in Ukrainian). This alkaloid is prepared also as Devinkan by the Ougrian Pharmaceutical Industry. In 1956 scientists succeeded in obtaining Reserpin and its analogues, Decaserpil, Siroingonin, Deserpидin, also synthetically, and which are less toxic for the organism. The composition LSD<sup>25</sup>, recently found synthetically, provoke optical and acoustic hallucinations. In smaller portions it is used for treatment of nervous disturbances. From LSD<sup>25</sup> the drugs Redergam, Dehydroergotamin and Dehydroergotoxin are obtained for use against high blood pressure, disorders in cerebral blood circulation and spontaneous gangrene. Mescalin and Bufo-tenin are now obtained synthetically, serving as foundations for hypotensive drugs and tranquilizers, such as: Meprometan (Ougrian Andaxin), Amizil (Benaktazin) and Diaphen. For treatment of depressive states the chemists found: Meridil (Ritalin), Piridrol, Imizin (Tofranil) and others.

U.

of gonadotropins (EG) were observed during the cycle in the white laboratory mice and the C<sub>57</sub> mice; during diestrus the secretion increased, and during estrus it diminished. In C<sub>3</sub>HA mice with an unbalanced nervous system (the excitatory process predominated over the inhibitory), the EG increased somewhat during the estrus stage, but in mice with strongly balanced nervous processes such disturbances of the rhythm of the GTP were almost absent. Administration of MF to C<sub>57</sub> mice failed to disturb the GTP. Forced breeding of the C<sub>57</sub> mice led to a marked increase of their sensitivity to MF (the frequency of tumor occurrence was about 90% instead of 9-14%). The disturbance of the rhythm of EG is one of the forms of hormonal disorders leading to the development of mammary carcinoma. -- V.S. Genes.

Abstract : A detailed description of a reconstruction method with  
utilization of graph paper is given. It is concluded  
that this method is less cumbersome than the one of  
plastic reconstruction.

ABSTRACT : In an embryo about 100 mm long on the level of  
the caudal part of the rhomboid fossa, a forma-  
tion develops which the author calls "organ IV  
of the brain ventricle". It contains in its  
tissue which is rich in vessels, branching  
tubules 100 mm in length, lined with cells which  
open into the cavity of the ventricle. Within  
the first years after birth the lumen of

Abstract : these tubules becomes irregular and in some places it is nearly or completely closed by the considerably changed elements of the lining. The involution of the organ is probably completed within the first years of life. In its formation and structure it is very similar to the precommissural organ, which was discovered by the author in the cap area of the diencephalon. Both formations initiate at the same time and become subjected to involution in the postembryonic period. -- I. I. Gutner

*Fukre KH, M.H.*

Substitution in the azolidine ring. III. Stability of rhodanines and their oximes. N. M. Turkevich and I. I. Kurnitskii (Inst. Med., Lvov). *Ukrain. Khim. Zhur.*, 16, No. 4, 451-8 (1959).—By following the reaction rates between NaHSO<sub>3</sub> and dil. aq. solns. of rhodanine (I), 5-methylrhodanine (II), and their oximes, 2-hydroxypseudothiohydantoin (III) and 2'-hydroxy-5-methylpseudothiohydantoin (IV), resp., by means of iodine titration of the unreacted bisulfite, it was concluded that the introduction of a Me group into the 5-position stabilizes the azolidine ring in I and III. The substitution of the isonitroso group with S similarly resulted in a stabilization of the ring and slower reaction rates with NaHSO<sub>3</sub>. Analogous reactions with benzylidene and 3-phenylrhodanines could not be studied because of the H<sub>2</sub>O-insol. of the 3 compds.

Substitution in the azolidino ring. IV. Synthesis of  
2,4-thiazolidinedione 3-oxime. N. M. Turkevich and O. I.  
Melnikuk (Inst. Med. Lvov). *Ukrain. Khim. Zhur.* 16  
No. 4, 459-64 (1950); cf. preceding abstr.—A mixt. of 0.03  
mole rhodanine in 50 ml. MeOH, 0.09 mole NH<sub>2</sub>OH.HCl in  
saturated H<sub>2</sub>O soln., and 0.09 mole anhyd. AcONa was refluxed  
4 hrs., the produced S filtered, and filtrate concd. to give  
34% NH.CO.CH<sub>2</sub>.SC.NOH (I), m. 189-90°. The following  
derivs. of I were also prep'd. similarly: 5-benzyl (II), m.  
230°; 5-Me (III), m. 183°; 2-Me (IV), m. 211°. Refluxing  
II (1 g.) with 10 ml. concd. HCl, extg. the mixt. with  $\text{BaO}_2$ ,  
and evapg. the ext. to dryness gave a solid, which was  
refluxed 0.5 hr. with 2 ml. AcOH, 0.5 g. AcONa, and 0.5 g.  
BaI<sub>2</sub>, the soln. concd. and cooled to yield crystals of  
NH.CO.C<sub>6</sub>H<sub>5</sub>.CH<sub>2</sub>.SC.CO, m. 230°. The oximes gave the  
following order in decreasing resistance to alk. hydrolysis:  
II > III > I > IV.

*QW*  
*MK*

TURKEVICH N.M.

*Substitution in the azolidine ring. V. Preparation of 2-thiono-4-oxazolidinone and its transformations.* N. K. Laleko and T. B. Gorizda (L'vov Inst. Med. i Fiz. Nauk Zhur. 16, 545-51 (1954) [in Russian], 4, 14, No. 2 (1948); 16, 539-64 (1950).—To 65 g.  $\beta$ -ketone and 2 mol. 30% HCl in little  $H_2O$  was added 31 ml. 72%  $HCHO$  and 2 mol. 30% HCl, the mixt. left overnight, filtered, and the filtrate refluxed 5 hrs. on a steam bath and exd. with  $Et_2O$ , yielding 17.9% 2-thioxo-4-oxazolidinone (I) m. 113°. This gives a weak SH test in 10%  $NH_4OH$  or  $Na_2CO_3$  with Na nitroprusside; in 10% NaOH the test is strong. Refluxed with aq.  $Ba(OH)_2$  3 hrs., I gave some HS and considerable CNS ion; the soln. contained  $HOCH_2COEt$ . I with  $PhNH_2$  in  $EtOH$  gave some HS even in the cold, and after heating on a steam bath yielded 92.5%  $Ph_2N$ , m. 152° (from  $AmOAc$ ), apparently not a phenylhydrazone of I but a cyclic anhydride. I (234 g.), 10 ml.  $Al(OH)_3$ , 2 g. dry  $NaOAc$ , and 3.2 g.  $BaH$  refluxed 1 hr. gave 72.5% 5-*benzylidene* deriv. (II), m. 188° (from  $EtOH$ ), which, heated with NaOH, gave a strong violet color, with nitroprusside; refluxed with  $Ba(OH)_2$  4 hrs., it liberated much CNS ion, with some HS, and  $PhCH_2COCO_2H$ , m. 150°, was isolated. Refluxing II with  $PhNH_2$  in  $EtOH$  gave a yellow product,  $C_9H_{11}NO_4$ , m. 107°. I heated with  $\alpha-HOC_6H_4CHO$ ,  $NaOAc$ , and  $AcOH$  gave 88% 5-( $\alpha$ - $HOC_6H_4CH_3$ ) deriv. m. 202° (from  $EtOH$ ). Similarly were obtained 80% 5-( $p$ - $MeOCH_2CH_2CH_3$ ), m. 178°, 85% 5-( $p$ - $MeOCH_2CH_3$ ), m. 162°, and 78.8% 5-( $p$ - $Me_2NC_6H_4CH_3$ ) derivs. m. 232°. All heated with aq. NaOH gave the SH test. VI. Synthesis and properties of 5-*ethyl*- and 5,5-dialkyl-2-thiono-4-oxazolidinones. Ibid. 552-7.—To 30.6 g. KCN and 48.3 g.  $N_2S$  in a little  $H_2O$  was added with cooling 53 g.  $PtCl_4$ , then 2 mol. 30% HCl over 45 min. and the mixt. heated on a steam bath 1 hr.,稀释 with  $H_2O$ , and cooled, yielding 64% 5-phenyl-2-thioxo-4-oxazolidinone (I), m. 130° (from  $H_2O$ ), boiled with aq. NaOH, it shows a strong SH reaction with

nitroprusside. I heated with  $PhNH_2$  in  $EtOH$  until HS evolution stopped gave 63% product, m. 161°, identified as the phenylhydrazone of I. KCN and KCNS with  $Me_2CO$  with slow addn. of 30% HCl gave 82% 5,5-dimethyl-2-thiono-4-oxazolidinone, m. 141°, which with  $PhNH_2$  in  $EtOH$  yielded the phenylhydrazone, m. 161°, which with  $Ph_2CO$  similarly gave 5-methyl-5-*cis*-4-oxazolidinone, m. 161°. The phenylhydrazones begin to form in this series even in the cold, with copious evolution of HS. VII. Condensation of thiodarane with esters of  $\beta$ -keto acids and with cyclic ketones. B. M. Turkevich and N. M. Turkevich (Ibid. 558-68).—Rhodanine (I) condenses with poorly reactive keto derivs. in sealed tubes at 130-50°. I (1.33 g.), 1.95 g.  $AcCH_2COEt$ , 10 ml.  $AcOH$ , and 2 g.  $NaOAc$  heated in a sealed tube 5 hrs. at 140-5° gave much  $CC_6$  and a trace of HS. Dila gave the 5-( $Me_2C_6$ ) deriv. of I.  $Ca(OH)_2$ , m. 160-2°. Similarly 5-( $Me_2C_6$ ) deriv. of I,  $Ca(OH)_2$ , m. 160-2°. Similarly  $AcCH_2(CH_2CH_2CH_2COEt)$  gave an inst. which on heat. with  $Et_2O$  and treatment with aq.  $AgNO_3$  yielded the  $Ag$  salt of the 5-( $CH_2CH_2CH_2CH_2COEt$ ) deriv. of I, the  $Hg$  salt was obtained sim. larly from  $HgCl_2$ . 3-Phenylrhodanine (II) with  $AcCH_2CH_2CH_2COEt$  gave the  $Ag$  and  $Hg$  salts of the 5-( $CH_2CH_2CH_2CH_2COEt$ ) deriv. of II. I similarly heated with  $PhCH_2(Ch_2CO_2Et)_2$  gave the 5-( $Et_2C$ )  $CH_2CH_2CH_2CH_2CO_2Et$  deriv. of I, decompr. above 160°, which, refluxed 20 min. in dil. NaOH, then acidified with HCl, gave  $AcC_6H_4CO_2Et$ .  $CH_2PhCH_2CH_2MeC(S)CO_2H$ , decomp. above 160°. I heated with  $AcC_6H_4CO_2Et$  above 160°, 3 hrs. gave the 5-( $AcCH_2CH_2CH_2CO_2Et$ ) deriv., decompr. above 160°. I (1.33 g.) similarly refluxed with 1.47 g. cyclohexanone, 10 ml.  $AcOH$ , and 1.6 g.  $NaOAc$  5 hrs. gave on diln. 1 g. 5-cyclohexylidene rhodanine, m. 170° (from  $EtOH$ ). II heated with the above reagents in sealed tubes 5 hrs. to 130-6° gave 5-cyclohexylidene deriv. of II, m. 150-2°. Cyclopentanone with I gave 5-cyclopentylidene rhodanine, m. 195.5-6.5° (decomp.). Reducing I with citric,  $NaOAc$ , and  $AcOH$  8

lvs. gave (from 1.33 g., I) some 0.8 g. orange 5-citrylidene-  
rhodanine [ $\delta$ -(3,7-dimethyl-2,6-octadienylidene)rhodanine], m. 101-2° (from EtOH); II gave the 5-citrylidene derivative, m. 101-2°.

VIII. Characteristic reactions of thiazolidines. N. M. Turkevich and M. P. Makukha (Lvov Med. Inst.). *J. Russ. Chem. Soc.*, 1907, 14, 102-61. Substituted rhodanines (28 examples) were tested for color reactions with several common metal ions, by mixing alc. solns. of the rhodanine deriv. with  $FeCl_3$ ,  $CuSO_4$ ,  $NiSO_4$ ,  $AgNO_3$ , and  $Na_3[Fe(CN)_6]NO_3$ , resp. (the latter reagent gave the best results with NaOH or EtONa added to the mixt.); with rhodanine (I) and its derivs. (substituents given) the results were:  $H$ , —, green, —, yellow, red-violet;  $5-Me$ , —, green, —, yellow, red-violet;  $3-Me$ , —, red, red, brown; blue-violet;  $3-Pk$ , —, red, red, brown, blue-red,  $3-C_6H_5$ , —, red, red, yellow, blue-violet or red;  $3-(p-NO_2C_6H_4)$ , —, red, red, yellow, blue or red;  $5,3-Me_2Ph$ , —, —, brown, brown;  $3,5-Pk(Me_2CH)$ , —, —, brown, brown-red; condensation product from  $I$  and  $Bz$ ,  $Bz$ , —, —, —, green-yellow, lilac;  $5-(PhCH_2)$ , —, —, —, green-yellow, —;  $3,5-Me_2PhCH_2$ , —, —, —, yellow-green, brown;  $3-(p-Me_2C_6H_4CH_2)$ , —, —, —, yellow with metal salts;  $3-(p-Me_2C_6H_4CH_2)$ , —, —, —, yellow with  $AgNO_3$ ;  $3,5-Pk(Ph-N_2C_6H_4CH_2)$ , —, —, —, yellow with  $CuSO_4$ ; 5-citrylidene, —, —, —, yellow with  $AgNO_3$ ; 5-citrylidene-3-phenyl, —, —, —, yellow, —;  $5-AcCH_2CH_2$ , —, —, —, yellow, brown;  $5-(Me_2C_6H_4CH_2)$ , —, —, —, yellow, —;  $5-(Me_2C_6H_4CH_2)$ , —, —, —, yellow, —;  $5-(Ph_2C_6H_4)$ , —, —, —, yellow, —;  $5-cydohexylidene$ , —, —, —, green-yellow, —;  $5-cydohexylidene-3-phenyl$ , —, —, —, brown, —; yellow-brown, —;  $5-(Me_2CH_2CH_2)$ , —, —, —, yellow, —;  $5-(Me(CH_2CH_2))_2$ , —, —, —, brown, —; yellow, red;  $3,5-(Me(CH_2CH_2))_2$ , —, —, —, brown, —; yellow, —. The following new rhodanines are reported: shaking an equimolar mixt. of  $PhNHCS(NH_2)_2$  and  $Me_2CHCHBrCO_2Na$  in  $H_2O$  gave on acidification 3-isopropyl- $\beta$ -phenylrhodanine, m. 83-4°. Condensation of  $\alpha$ -aminocamphor, CS<sub>2</sub>, NH<sub>4</sub>OH, and  $C_6H_5CO_2Na$  gave a yellow resinous product, but its behavior indicated the structure of a

rhodanine. Condensation of I with urettropine in alc. NaOH soln. gave a yellow condensation product,  $C_{13}H_{14}O_2N_4S_2$ , decomp. 239°, which shows 2 acidic H atoms on titration. Nitroprusside reagent in concd. NaOH can be used to detect 3-substituted rhodanines, a blue or violet-blue ppt. being formed if the 6-position is unsubstituted. Tests with pseudohydantoin were made similarly (substituents given, and the metal ions listed in the same order as above):  $H$ , —, —, —, white, brown;  $5-PkCH_2$ , —, —, —, white, —;  $3$ -allyl (chloride), —, —, —, violet-red. Benzoylurethodanine phenylhydrazone, brown, brown, —, yellow, —, —. Rhodanine oximes:  $H$ , lilac, green, —, white, —;  $5-Me$ , lilac, green, —, white, —;  $3-Me$ , —, —, —, brown;  $5-PkCH_2$ , lilac, green, —, green, —. No penicillin gave a yellow color with  $AgNO_3$  and brown with nitroprusside and EtONa. 4-Thiazolidinones, 2,3-Pk<sub>2</sub>, gave only a brown color with nitroprusside and EtONa;  $5,2,3-Me_2Pk_2$ , and  $5$ -methylthiazolidine gave a red-brown color with  $FeCl_3$  only;  $2-Pk-3-(3,2-Me(HOCH_2CH_2)XHOCH_2CH_2)$ , and  $5,3,3-Me_2(HOCH_2CH_2XHOCH_2CH_2)$ , gave only brown color with nitroprusside and EtONa;  $3,3,2-Me(HOCH_2CH_2)(CH_2)_2H_2$  gave the same result. Thiazolidindiones give no color tests, while its  $5-(PhCH_2)$  deriv. gave only white ppt. with  $AgNO_3$ . A red-brown color with  $FeCl_3$  formed with the 5-oxazolidone, its  $5,5-Me_2$ ,  $5,5-Me_2$ ,  $5-Pk$ ,  $5-PkCH_2$ , and  $5-PkCH_2CH_2$  derivs. White or greenish ppts. with  $AgNO_3$  were obtained with the above derivs. (except 5-methyl-5-ethyl) and with the 5-furfurylidene deriv. The 5-methoxy-deriv. gave a yellow color with  $AgNO_3$ , the methyl group being formed with the  $5-(p-Me_2YC_6H_4)H$ .

*Isoguanidine deriv.* Heating concd. solns. of  $NH_4CNS$  and  $C_4CCO_2H$  gave yellow xanthanhydride, or  $C_6H_5N_4S_2$ , whose properties resemble those of pseudothiophantoin.

G. M. Kosolapoff

Turkevich, N. M.

Transformations of thioglycolamides and their carbamoyl derivatives. N. M. Turkevich and N. P. Yavorskii (Lvov Med. Inst.). ZH. ANDR. KALIN. ZHAR., 16, No. 6, 639-47 (1950) (in Russian).—Amides of  $H_2NCOSCH_2CO_2H$  (I) and  $HSC(=O)CO_2H$  are converted by  $PbSO_4Cl$  in alk. medium into amides of  $S(CH_2CO_2H)_2$ . Amides of I are reagents for  $Ag$  and  $Hg$  ions.  $H_2NCOSCH_2CONHPh$  (II) (2.1 g.) in 15 ml.  $aq.$  soln. of 1.6%  $NaOH$  filtered and the filtrate treated with 2.1 g.  $BaCl_2$  yielded 100%  $S(CH_2CONBzPh)_2$  m. 145-6°. Similar reaction with  $PbSO_4Cl$  gave 99.3%  $S(CH_2CONHPh)_2$ , m. 135°, formed also in good yield (m. 145-6°) on heating I with  $BaCl_2$  in  $EtOH$ .  $CICH_2CO_2H$ , phenetidine, and  $NH_4CNS$  in  $MeOH$  gave 67%  $(\mu-Et_2NCO_2CH_2CONHCO_2Et)_2$ , m. 175-7°. This (2.04 g.) in 10 ml. 5%  $NaOH$  (1.6 g.  $NaOH$ ), treated with 2.1 g.  $BaCl_2$  gave 95.5%  $(\mu-EtOCO_2Et)_2CO_2H_2S$ , m. 145-6° (from  $EtOH$ ). Similar reaction with  $PbSO_4Cl$  gave  $(\mu-EtOCO_2Et)_2NHCO_2CH_2S$ , m. 158° (from  $EtOH$ ). Reducing 12.6 g.  $C_6H_5CO_2H$  to 10.2 g.  $NH_4CNS$ , and 15.0 g.  $Et_2NHPh$  in  $MeOH$  5 hrs. gave 82%  $H_2NCOSCH_2CONHPh$ , m. 110° (from  $C_6H_5CO_2H$ ).  $2-C_6H_5NHCOCH_2SH$  reduced 10 hrs. in  $C_6H_6$  with 1.3 g.  $BaCl_2$  gave  $(2-C_6H_5NHCOCH_2S)_2ClPh$ , m. 157-9°; the original amide treated with  $BaCl_2$  in aq.  $NaOH$ , as described above, formed 100%  $(2-C_6H_5NH_2COCH_2S)_2$ , m. 160-1°; a similar reaction with  $PbSO_4Cl$  gave  $(2-C_6H_5NHCOCH_2)_2S$ , m. 200°. The dithioglycolamide, heated above, gave yellow-brown or brown colors with ammonium salts of  $CuSO_4$ ,  $AgNO_3$ ,  $HgCl_2$ , and nitroprusside. The  $Ba$  deriv. gave a white ppt. with ammonium  $N_3NO_3$ . G. M. Kosolapoff

*Turkevich, N.M.*

Soluble compounds of bismuth. VI. Structure of bis-bismuth lactate. N. P. Vavorskii and N. M. Turkevich (Med. Inst., Lvov). *Ukrain. Khim. Zhur.*, 18, 371-5 (1952); *C.A.*, 48, 3693f.—The water-sol. Bi lactate is really bis-bismuthate  $\text{Bi}_2(\text{CH}_3\text{COO})_2\text{Bi(OH)}_3$  (Telle, C.A., 48, 373); its stability as a complex is poor since with a variety of reagents (H<sub>2</sub>S, NH<sub>3</sub>, alkalies, chromates, phosphates, iodides, and iodates) it yields ppts., while org. acids yield insol. org. Bi compounds. Treatment of 35 g. moist freshly prepnd. Bi(OH)<sub>3</sub> with 10 ml. H<sub>2</sub>O followed by 30 g. MeCH(OH)CO<sub>2</sub>H and 5 vol. EtOH gave 20 g. colorless solid,  $\text{C}_4\text{H}_9\text{O}_3\text{Bi}$ , an anhydride lactate of Bi; it is generally insol. except for mineral acids; it forms a sol. complex with Na lactate. The same *insol.* substance forms on refluxing I in C<sub>2</sub>H<sub>5</sub>OH in the presence of PhNH<sub>2</sub>, with azeotropic removal of H<sub>2</sub>O; it also forms on treatment of lactic acid in H<sub>2</sub>O with Bi(OH)<sub>3</sub> and keeping the mixture, after initial warming to 55° and filtration, for 7 days. Addn. of 10 g. Bi nitro-tartrate to 21 g. MeCH(OH)CO<sub>2</sub>H in 35 g. H<sub>2</sub>O at the b.p. and refluxing 2 hrs. gave after filtration, while hot, 2.2 g. *dibutylbismuthtartric-acid*,  $\text{C}_{10}\text{H}_{19}\text{O}_5\text{Bi}$ ; which is insol. in H<sub>2</sub>O and sol. in NH<sub>4</sub>OH and alkalies; it forms sol. complexes with Na lactate and tartrate. G. M. Kosolapoff

Substitutions in the 2-pyridine ring. IX. Stability of thiazolidine rings in alkaline hydrolysis. N. M. Tsvetkova and B. I. Shvydkii (Med. Inst. Leningrad Univ., Russ. *Zhur.* 18, 513-18 (1952) (in Russian); cf. *C.A.* 48, 113926). On the basis of the rate of hydrolysis by *N*, 0.4*N*, and 0.01*N* NaOH, the ring stability of the following compounds was found to depend on the function at position 2 (stability increased in the order :NO<sub>2</sub>, :S, :O, and :NH): pseudothiohydantoin, its 5-Me and 5-Ph derivs., thiazolidinedione, and rhodanine and its 5-Me deriv. The Ph group in 5 position stabilizes the ring, while the 5-Me group stabilizes rhodanine, but not pseudothiohydantoin. Hydrolysis results in formation of mercapto carboxylic acids. G. M. Kosolapoff

**Effect of ammonium and potassium salts on stability and viscosity of milk casein.** N. M. Turkevich (Lvov State Med. Inst.). *Zhur. Priklad. Khim.* (J. Applied Chem.) 25, 104-8 (1952). Casein prepn. treated with aq. NaOH was studied in respect to the rate of filtration and the magnitude of viscosity (steel-ball method). The solns. coagulate completely on standing 12 hrs. per se. Addn. of a small amt. of 25% NH<sub>4</sub>OH increases the viscosity of soln. but delays coagulation by 4 hrs. Likewise, NH<sub>4</sub> H citrate, fluoride, tartrate, and oxalate and K H oxalate greatly improve the interactivity of the soln. and lead to a more gradual rise of viscosity with time. G. M. Kosolapoff

✓ Polymeric compounds of bismuth. N. M. Turkevich.  
Sovetskaya Nauka, Rabat, Vietnams. Kvant. OCHERKOV  
im. Mendeleeva 1953, No. 1, 18-23. Referat. ZHFK, KHM.  
1954, No. 1754. -The polymeric structures of acetyl bis-  
muth tartrate (I) and of Pi acetylnitrotartrate (II) were  
studied. The elementary analysis gave for I the compo-  
nents, a method based on studying the changes in  
 $C_4H_4O_4Bi_4$  for II,  $C_6H_6O_4N_2Bi_4$ . The detn. of the  
end groups, a method based on studying the changes in  
simple or mixed salts of volatile acids upon heating, shows  
that I is at least tetrameric. Splitting off  $H_2O$  from I and  
II by heating to 80-105° leads to the formation of 5-mem-  
bered rings. A study of the hydrolysis products of NH<sub>4</sub>  
bismuth tartrate showed that it is at least decameric.

Title : Glucoside of smartweed

Periodical : Ukr. khim. zhur. 20, Ed. 4, 396 - 398, 1954

Abstract : Smartweed, stabilized with alcohol vapors, was investigated to determine the chemical and medicinal values of the glucoside usually found in the weed. It was established that the semiacetal hydroxyl group, in the structure of the glucoside, is in a free, nonsubstituted state. The actual glucoside content of the weed was determined by the ether number of the glucoside-containing extract. Five references: 2-USSR; 1-Ukrainina; 1-USA; 1-French (1908-1953). Table.

Title : Bismuth aminates, their structure and formation in aqueous solutions

Periodical : Zhur. ob. khim. 24/6, 978-983, June 1954

Abstract : The derivation of Bi-iodide aminates, through the reaction of amines with neutral aqueous solutions of potassium iodobismuthate, is described. The coordination number of Bi-atoms, present in the molecules of its aminates, was determined. The polynuclear structure of a majority of Bi-iodide aminates was analytically established. The chemical properties, of products obtained through the addition of Bi-iodide to p-dimethylamino-benzaldehyde and thiourea, are described. Fourteen references: 8-German and 6-USSR (1862-1953).

~~Chemical properties of the compound~~  
The compound has the characteristic properties of the  
group IVA elements. It is soluble in organic solvents and  
red in color. It is easily oxidized. A violent  
reaction is often observed. The oxidation  
destroys the analytical properties of the unchanged compound.  
The groups  $\text{NHC}(\text{O})\text{Cl}$  and  $\text{C}(\text{O})\text{C}(\text{SH})_2$  are functional  
analytical groups for the element, the former giving a blue  
and the latter a blue color. The N group nonacetylated  
is also useful for IR analysis. Also in *J. Anal. Chem.*

TITLE: Synthesis of Thiazolidone Derivatives Which are of Biological Interest (Sintez proizvodnykh tiazolidona, predstavlyayushchikh biologicheskiy interes). VII. Synthesis of N-Substituted Thiocyano-Derivatives Starting From Thiocyano-Acetates (VII. Sintez N - zameshchennykh proizvednykh rodnina, iskhodya iz rodanoatsetatov).

PERIODICAL: Zhurnal Obshchey Khimii, 1957, Vol. 27, Nr 12, pp. 3275-3278 (USSR).

ABSTRACT: Of late a certain importance was attributed to N-substituted thiocyano-derivatives because of their fungicidal properties. The syntheses of these compounds mentioned in publications hitherto suffer from a great number of deficiencies. By means of investigations the authors stated that the most useful initial products for the synthesis of N-thiocyano-derivatives are the salts of thiocyano-acetic acid which are of great stability and can easily be obtained by reaction of thiocyanate potassium on the sodium salt of monochloro-acetic acid (see reaction process). As a condensation means glacial acetic acid was used which has the task to convert thiocyano-acetates to acetic acid and to bind the separating ammonia. The saponification of the thiocyanate group is introduced by small amounts of water present in ace-
